Selecting the Best JFET for Your Application

Introduction

This application note contains design curves for all of Fairchild Semiconductor discrete JFET processes. JFET process characteristics provide complete information on all processes, including all parts manufactured from a particular process. This can greatly aid device selection or substitution. In all cases, temperature and $V_{GS(off)}$ distribution data is provided to facilitate worst-case design. In addition, a complete list of all device types supplied from this process is included to aid in cross reference searches and the selection of preferred device types. Preferred parts are shown with gray overprinting. The curves in this section should be considered typical of the process supplied by Fairchild Semiconductor. Every effort is made to keep the process in tolerance with the published graphs, but the exact distribution of any specific lot of material is not guaranteed.

How to use the Application Note

The following suggested procedure will help you find the device you need.

Part Number Known: Go to the Fairchild web site and type in the part number. If alternate type is required, refer to the online cross reference guide.

Specification Known: Refer to Figure 2, "JFET Process Family Tree" on page 4 of this application note to find the most compatible process. Then turn to Figure 3, "JFET Process Comparison Curves", on page 6 to compare the specifications of each process type. Finally, turn to page 16 for a detailed listing of process characteristics and specific

device type numbers available in that process. Take special note of preferred part types. Full data sheets are available on line.

Application Known: Turn to "Choose the Proper FET" and Figure 2, "JFET Process Tree" on page 4. Also Table 2, "Advantages of Using JFET by Application" on page 3. Finally, refer to 0, "Applications and Their Parameters in Approximate Order of Importance" on page 2 as needed.

None of the Above: Contact local representative or regional office for assistance.

JFET Application Guide

Fairchild Semiconductor manufactures a broad line of silicon junction field effect transistors (JFETs). Fairchild's JFETs provide excellent performance in many application areas such as RF amplifiers, analog switching low input current amplifiers, ultra low noise amplifiers and outstanding matched duals for operational amplifiers input applications.

Table 1 is a guide to enable the user to determine what parameters are important in each application. This followed by a listing of JFET Parameter Relationships in Figure 1. Table 2 lists many application advantages of JFETs by application.

$$I_D = I_{DSS} \left(1 - \frac{V_{GS}}{V_{GS(OFF)}} \right)^2$$

Variation of drain current with gate bias. Square law transfer characteristic.

$$g_{fs} = g_{fso} \sqrt{I_D / I_{DSS}}$$

Variation in transconductance with drain current.

$$V_{GS(OFF)} = \frac{2 I_{DSS}}{g_{fso}}$$

Gate-source cutoff voltage in terms of I_{DSS} and g_{fso} .

$$r_{DS} \approx \frac{1}{g_{fs}}$$

Relationship between r_{DS} and g_{fs} in the triode region (i.e., $V_{DS} < V_{GS(OFF)}$).

$$V_{GS} = V_{GS(OFF)} \left(1 - \left(\frac{I_D}{I_{DSS}} \right)^{1/2} \right)$$

Gate-source voltage in terms of operating current I_D , I_{DSS} , and $V_{GS(OFF)}$.

$$r_{DS} \approx \frac{r_{DS(0)}}{1 - \frac{V_{GS}}{V_{GS(OFF)}}}$$

Variation of drain resistance with gate bias in terms zero bias resistance (r_{DS0}) and $V_{GS(OFF)}$.

$$g_{fso} = K \frac{I_{DSS}}{V_{GS(OFF)}}$$

Transconductance at zero gate voltage in terms of I_{DSS} and $V_{GS(off)}$. $K = 1.1$ to 2.5 . Typically 2 for N-channel JFETs.

$$r_{DS} \approx \frac{K V_{GS(OFF)}^2}{I_{DSS}(V_{GS(OFF)} - V_{GS})}$$

$$K = 0.5 - 0.9$$

Variation of drain resistance in terms of V_{GS} , and $V_{GS(OFF)}$ I_{DSS} .

$$g_{fs} = g_{fso} \left(1 - \frac{V_{GS}}{V_{GS(OFF)}} \right)$$

Variation in transconductance with gate bias.

$$r_{DST} \approx r_{DS @ 25^\circ C} (1 + 0.007 (\Delta T))$$

Variation of ON resistance as a function of temperature.

APPLICATION	ADVANTAGES	FINAL ASSEMBLY WHERE USED
DC Amplifiers	High Z_{in} Low drift duals Low noise	Transducers, military guidance systems, control systems, temp indicators, multimeters
Low frequency amplifiers	Small coupling capacitors Low noise, distortion High input impedance	Sound detection, microphones, inductive transducers, hearing aids, high impedance transducers
Operational amplifiers	Summing point essentially zero. Low device noise. Less loading of transducers	Control systems, potted op amps, test equipment, medical electronics
Medium and high frequency amplifiers	Low cross modulation Low device noise Simplified circuitry	FM tuners, communication received scope inputs, most instrumentation equipment, high impedance inputs
Mixers — 100 MHz and up	Low mixing noise Low cross modulation	FM tuners, communication receivers
Oscillators	Low drift	Transmitters, receivers, organ
Logic gates	Virtually infinite fan in Simplified circuitry Zero storage time Symmetrical	Guidance controls, computer market mini military teaching aids, traffic control, telemetry
Choppers	Zero offset Low leakage currents Simplified circuitry Eliminates input transformers	Op amp modules guidance controls instrumentation equipment
AD Converters Multiplex switching (arrays) and sample hold	Improved isolation of input and output. Zero offset. Symmetrical. Low resistance Simplified circuitry	Control system, DVM's and any read-out equipment, medical electronics
Relay contact replacement	Solid state reliability Zero offset, High isolation Symmetrical No inductive spring No contact bounce High repetition rate	Test equipment, airborne equipment instrumentation market
Voltage variable resistor	Symmetrical Solid state reliability Functions as variable resistor. Low noise. High isolation Improved resolution	Organ, tone controls, control ckts to input operational amplifiers
Current limiters Sources	Two lead simplicity Wide selection range Low voltage operation	Hybrid circuits, amplifiers, power supply protection, timing ckts, voltage regulators

Choose the Proper JFET

Fairchild Semiconductor utilizes 17 different JFET geometries to cover, without compromise, the full spectrum of applications. Specific part number characteristics are summarized into application areas further on within this app note. In addition, this app note includes process comparison charts which graphically indicate the typical values of a given parameter for all geometries under identical test

conditions. Detailed data on each process, along with a list of all part numbers manufactured from each process, is also supplied.

Figure 2, gives a look at the characteristics for each process type to help the designer select the process that best meets his requirements. Table 3 shows which application the process was designed to best serve. After narrowing down the process types, it is suggested that the process sheets and specific part number characteristics be consulted.

All values are typical

JFET Process Characteristics

This section contains complete design curves for all of Fairchild Semiconductor's discrete JFET processes. Temperature and $V_{GS(off)}$ distribution data is provided to facilitate worst-case design. In addition a complete list of all device types supplied from this process is included to aid in cross reference searches and the selection of preferred

device types. The curves in this section should be considered typical of the process supplied by Fairchild Semiconductor. Every effort is made to keep the process in tolerance with the published graphs, but the exact distribution of any specific lot of material is not guaranteed.

GATE IS ALSO BACKSIDE CONTACT

DESCRIPTION

Process 50 is designed primarily for RF amplifier and mixer applications. It will operate up to 450 MHz with low noise figure and good power gain. These devices offer outstanding performance at VHF aircraft and communications frequencies. Their major advantage is low crossmodulation and intermodulation, low noise figure and good power gain. The device is also a good choice for analog switching where low capacitance is very important.

DESCRIPTION

Process 51 is designed primarily for electronic switching applications such as low ON resistance analog switching. It features excellent C_{iss} , $R_{DS(ON)}$ time constant. The inherent zero offset voltage and low leakage current make these devices excellent for chopper stabilized amplifiers, sample and hold circuits, and reset switches. Low feed-through capacitance also allows them to handle video signals to 100 MHz.

DESCRIPTION

Process 52 is designed primarily for low level audio and general purpose applications. These devices provide excellent performance as input stages for piezo electric transducers or other high impedance signal sources. Their high output impedance and high voltage breakdown lend them to high gain audio and video amplifier applications. Source and drain are interchangeable.

Process 53

Process 55 N-Channel JFET

DESCRIPTION

Process 55 is a general purpose low level audio amplifier and switching transistor. Wafer processing is similar to process 52 but process 55 uses a larger geometry. This results in higher Y_{fs} , I_{DSS} , and capacitance and lower $R_{DS(ON)}$. It is useful for audio and video frequency amplifiers and RF amplifiers under 50 MHz. It may also be used for analog switching applications.

Process 55

Process 58 N-Channel JFET

DESCRIPTION

Process 58 was developed for analog or digital switching applications where very low $r_{DS(ON)}$ is mandatory. Switching times are very fast and $R_{DS(ON)} C_{iss}$ time constant is low. The 6Ω typical on resistance is very useful in precision multiplex systems where switch resistance must be held to an absolute minimum. With r_{DS} increasing only $0.7\%/^{\circ}\text{C}$, accuracy is retained over a wide temperature excursion.

Process 83 N-Channel JFET

DESCRIPTION

Process 83 is a monolithic dual JFET with a diode isolated substrate. It is intended for operational amplifier input buffer applications. Processing results in low input bias current and virtually unmeasurable offset current. Likewise matching characteristics are virtually independent of operating current and voltage, providing design flexibility. Most GP 2N types are sorted from this family.

Process 84 N-Channel JFET

DESCRIPTION

Process 84 is a monolithic dual JFET with a diode isolated substrate. It is designed for the most critical operational amplifier input stages or electrometer single ended preamp. Ideal for medical applications and instrumentation inputs where subpicoamp inputs are important. Device design considered high CMRR, subpicoamp leakage over wide input swings, low capacitance, and tight match over wide current range.

Process 88 P-Channel JFET

DESCRIPTION

Process 88 is designed primarily for electronic switching applications where a P channel device is desirable. Inherent zero offset voltage, low leakage and low $R_{DS(ON)}$ C_{iss} time constant make this device excellent for low level analog switching, sample and hold circuits and chopper stabilized amplifiers. This device is the complement to Process 51.

DESCRIPTION

Process 90 is designed for VHF/UHF mixer/amplifier and applications where Process 50 is not adequate. Has sufficient gain and low noise, common gate configuration at 450 MHz, for sensitive receivers. The high transconductance and square law characteristics insures low crossmodulation and intermodulation distortions. Common-gate operation simplifies circuitry. Consider Process 92 for even higher performance.

DESCRIPTION

Process 93 is a monolithic dual JFET with a diode isolated substrate. It is intended for wide band, low noise, single ended video amplifier input stages, and high slew rate op amps. Monolithic structure eliminates thermal transient errors, and provides freedom to pick operating current and voltage.

Process 93 P-Channel JFET

DESCRIPTION

Process 94 is a monolithic dual JFET. It is strictly intended for operational amplifier input buffer applications. Special processing results in extremely low input bias current and virtually unmeasurable offset current. It is important to note that the <5 pico ampere bias current is measured at 35 volts. Typical CMRR is 125 dB. Performance superior to electrometer tubes can be readily achieved with low offset voltage and almost zero long term drift.

Process 98 N-Channel JFET

DESCRIPTION

Process 98 is a high gain, general purpose, monolithic dual JFET with a diode isolated substrate. It is intended for amplifier input stages requiring high gain, low noise and low offset drift over temperature. Strict processing controls result in low input bias currents and virtually immeasurable offset currents. Matching characteristics are essentially independent of operating current and voltage.
