(by partition)

$$\mathbf{AB} = \begin{vmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{vmatrix} \begin{vmatrix} B_{11} \\ B_{21} \end{vmatrix}$$

That means $A_{11}, A_{12}, A_{21}, A_{22}$ represents a 4×4 matrix and B_{11} and B_{21} represents a 4×1 matrix.

Now multiplying the representative matrix, we now have:

$$AB = \begin{vmatrix} A_{11}B_{11} + A_{12}B_{21} \\ A_{21}B_{11} + A_{22}B_{21} \end{vmatrix}$$

This means a 2×1 matrix and, substituting the entries for $A_{11}B_{11} + A_{12}B_{21}$ and $A_{21}B_{11} + A_{22}B_{21}$ which has a 4×1 entry each. In doing so, you arrive at an 8×1 matrix, since an 8×8 matrix multiplied by a 8×1 matrix gives you an 8×1 matrix.

This method is called Partitioning, it is used in multiplying an $n \times n$ matrix with more than 3×3 entries.
