

### Features

- n High-speed – 15/20/25/35 ns
- n Low Power dissipation:  
MS62256HL  
1.1W (Max.) Operating  
1mW (Max.) Power down
- n Fully static operation
- n All inputs and outputs directly TTL compatible
- n Three state outputs
- n Ultra low data retention supply current at  
 $V_{CC} = 2V$

### Description

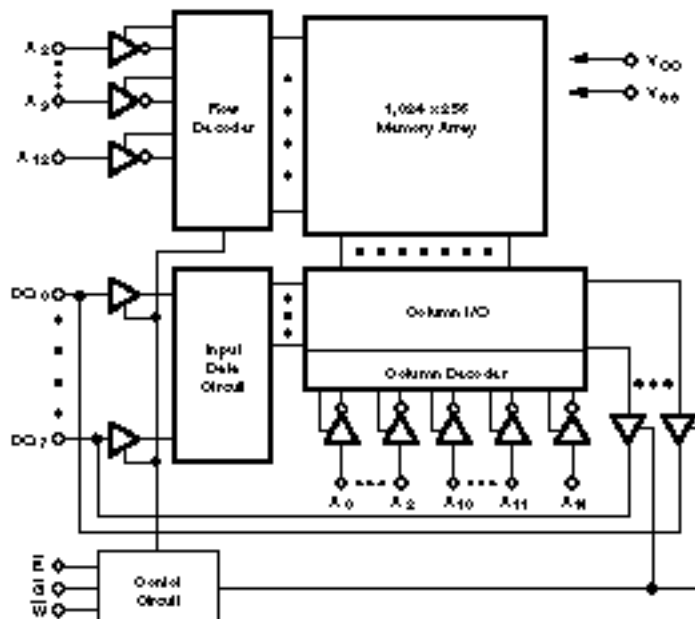

The MS62256H is a 262,144-bit static random access memory organized as 32,768 words by 8 bits and operates from a single 5 volt supply. It is built with MOSEL-VITELIC's high performance twin tub CMOS process. Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures. The MS62256H is available in the following standard 28-pin packages:

- 600 MIL Plastic DIP
- 300 MIL Plastic DIP
- 300 MIL Small Outline J-Bend (SOJ)

### Pin Configurations

### Functional Block Diagram

**Pin Descriptions****A<sub>0</sub> - A<sub>14</sub> Address Inputs**

These 15 address inputs select one of the 32768 8-bit words in the RAM.

**E Chip Enable Input**

E is active LOW. The chip enable must be active to read from or write to the device. If it is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high-impedance state when deselected.

**G Output Enable Input**

The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when G is inactive.

**W Write Enable Input**

The write enable input is active LOW and controls read and write operations. With the chip enabled, when W is HIGH and G is LOW, output data will be present at the DQ pins; when W is LOW, the data present on the DQ pins will be written into the selected memory location.

**DQ<sub>0</sub> - DQ<sub>7</sub> Data Input/Output Ports**

These 8 bidirectional ports are used to read data from or write data into the RAM.

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability and degrade performance characteristics.

## NOTES:

1.  $\bar{W}$  is High for READ Cycle.
2. Device is continuously selected  $\bar{E} = V_{IL}$ .
3. Address valid prior to or coincident with  $\bar{E}$  transition low.
4.  $\bar{G} = V_{IL}$ .
5. Transition is measured  $\pm 500\text{mV}$  from steady state with  $C_L = 5\text{pF}$  as shown in Figure 1b. This parameter is guaranteed and not 100% tested.

**Switching Waveforms (Write Cycle)****WRITE CYCLE 1<sup>(1)</sup>**

**Switching Waveforms (Write Cycle)****WRITE CYCLE 2<sup>(1,6)</sup>****NOTES:**

1.  $\overline{W}$  must be high during address transitions.
2. The internal write time of the memory is defined by the overlap  $\overline{E}$  active and  $\overline{W}$  low. Both signals must be active to initiate and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3.  $T_{WR}$  is measured from the earlier of  $\overline{E}$  or  $\overline{W}$  going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the  $\overline{E}$  low transition occurs simultaneously with the  $\overline{W}$  low transitions or after the  $\overline{W}$  low transition, outputs remain in a high impedance state.
6.  $\overline{G}$  is continuously low ( $\overline{G} = V_{IL}$ ).
7.  $D_{OUT}$  is the same phase of write data of this write cycle.
8.  $D_{OUT}$  is the read data of next address.
9. If  $\overline{E}$  is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured  $\pm 500\text{mV}$  from steady state with  $C_L = 5\text{pF}$  as shown in Figure 1b on page 4. This parameter is guaranteed and not 100% tested.
11.  $t_{CW}$  is measured from  $\overline{E}$  going low to the end of write.
